

ULTRA SLIM DOOR WEDGE ALARM

Modern vibration alarm for under doors

Product Code: EL00234

Introduction

The Ultra Slim Door Wedge Alarm can be instantly installed under internal doors. When armed it will respond to any banging or forced entry attempt by releasing a piercing 125dBs siren, sure to deter any intruders and attract attention. When not armed, it serves as a regular, reliable door wedge.

Operation

Before first time use please remove the battery tab (see Battery section below).

Toggle the side switch between ON/OFF to activate/deactivate the alarm.

When set to ON, after a period of 5 seconds a short beep sounds - your alarm's shock sensor is now active and direct vibration to the protected door will trigger it.

When triggered the siren will sound continuously for 30 seconds and stop. Any additional vibration will trigger the alarm again and repeat the cycle.

When set to OFF, the alarm immediately ceases vibration detect mode. You can also switch to OFF to silence an existing siren.

Installation - NOTE: FOR INTERNAL USE ONLY

Simply affix the wedge underneath your desired door when it is closed or ajar.

The wedge will fit gaps between the door and floor of 5-15mm.

The quality silicone material on the base will grip against any floor material, providing additional protection against a door being opened or forced.

Batteries and Replacement

The alarm is powered by 3 x LR44 batteries within the compartment on the base of the unit. Before first use, pull the small plastic tab protruding from the compartment to allow power to flow.

Test regularly and if you notice the siren sounding quieter than usual, you should change the batteries. To do this, detach the compartment with a phillips screwdriver, replace batteries with correct polarity and re-attach the compartment.

NOTE: It is advised to change batteries once per year, whether the product is in use or not.
